

Use of AI Tools Report

Purpose of Using AI Tools

During the development of the **EventsX website project** for the **CSE211 Web Programming course**, AI-based tools were used **as supportive learning assistants**. The primary goal of using these tools was to **enhance understanding, validate implementations, and ensure correctness**, rather than to copy or directly reuse generated content.

How AI Tools Were Used

1. Concept Explanation and Learning

- To clarify the correct use of accessibility features (ARIA roles, heading hierarchy, alt attributes).
- To learn best practices for website structure, responsiveness, and usability.

2. Validation and Error Checking

- To identify and understand HTML validation warnings and errors (e.g., heading level hierarchy, unnecessary ARIA roles).
- To confirm that the website structure follows W3C standards.
- To verify that navigation links and page flows function correctly.

3. Code Explanation and Debugging Support

- To help understand why certain issues occurred and how to fix them.
- To validate JavaScript logic used in features such as the budget calculator and form handling.

4. Design and Structural Guidance

- To suggest logical website organization and sitemap structure.
- To review folder organization (CSS, scripts, images, videos) for maintainability.
- To ensure consistency across all website pages.
